

Substation resurfacing and road widening

National Grid

The surfacing division in partnership with Ducron Construction completed a project to widen two roads surrounding the National Grid Substation and resurface the entire 2500 m² of access roads.

All site personnel were required to obtain the National Grid safety awareness certificate before the works could commence, we then carried out a variety of civil engineering works, such as excavation to the correct levels, laying of the sub-base and kerbs before finally laying binder and plane out and overlay the access roads.
